IoT Gateway... for multiple scenarios!

WAVECOM - IoT GATEWAY

Wavecom IoT Gateway is an Internet of Things network access solution, designed for a wide range of applications, allowing different types of devices from different technologies, to communicate with applications with very high efficiency, reliability, and scalability.

It is modular allowing multiple wireless interfaces such as LoRaWAN®, Wi-Fi and 3G/4G/5G and provides an over-the-top WAN backbone.

On the other hand, the enclosure of the Wavecom IoT Gateway is built in aluminum providing an electromagnetic isolation between the internal radio modules and temperature's dissipation, which allows its use in various indoor/outdoor application scenarios.

It is always connected to a cloud managed platform (i.e. Wavecom IoT Manager/Multi-Tenant system) responsible for the integrated management of the gateways, providing reports and visualization of the data read from LoRaWAN assets. This platform allows connection with third parties via API.
